Model of Health Care Disparities

Source: Gennep and McGuire, 2001

Do you think the average African American is better off, worse off, or just about as well off as the average white person in terms of access to health care?

Table 1. Description of HEDIS Measures of Quality of Care.*

Measure	Description	Years
Breast/cancer screening		
Mammograms	Mammography within the past two years for women 45-49 yr	1997-2003
Diabetes care		
Eye examination	Retinal examination by an eye care professional within the past year	1999-2003
Testing of glycosylated hemoglobin level	Testing of glycosylated hemoglobin within past year	1999-2003
Control of glycosylated hemoglobin level	Levels of glycosylated hemoglobin below 9.5%	1999-2002†
Testing of LDL cholesterol level	Testing for LDL cholesterol within past year	1999-2003
Control of LDL cholesterol level	Level of LDL cholesterol below 130 mg/dl	1999-2003
Cardiovascular care		
Beta-blocker use	Receipt of a prescription for a beta-blocker within seven days after discharge from hospital for treatment of acute myocardial infarction	1997-2002†
Testing of LDL cholesterol level	Testing of LDL cholesterol after discharge from hospital for treatment of acute myocardial infarction, coronary artery bypass graft, or percutaneous transluminal coronary angioplasty	1999-2003
Control of LDL cholesterol level	Level of LDL below 130 mg/dl after discharge from hospital for treatment of acute myocardial infarction, coronary artery bypass graft, or percutaneous transluminal coronary angioplasty	1999-2002†

The average life expectancy for the state of Nebraska in the three-year period, 2000-2002 was 78.3 years for whites, 71.6 years for African Americans and 67.9 years for Native Americans

THE CARDIAC CENTER

Evidence of Racial and Ethnic Disparities in Healthcare

- Disparities consistently found across a wide range of disease areas and clinical services
- Disparities are found even when clinical factors, such as stage of disease presentation, co-morbidities, age, and severity of disease are taken into account
- Disparities are found across a range of clinical settings, including public and private hospitals, teaching and non-teaching hospitals, etc.
- Disparities in care are associated with higher mortality among minorities (e.g., Bach et al., 1999; Peterson et al., 1997; Bennett et al., 1995)

What Are Potential Sources of Disparities In Care?

- Health systems-level factors – financing, structure of care; cultural and linguistic barriers
- Patient-level factors – including patient preferences, refusal of treatment, poor adherence, biological differences
- Disparities arising from the clinical encounter

Caveats – *Unequal Treatment*

- Access (e.g., insurance status, ability to pay for healthcare) is *the* most important predictor of the quality of healthcare across racial and ethnic groups
- It is difficult – even artificial – to separate access-related factors from social categories such as race and ethnicity
- The bulk of research on healthcare disparities has focused on black-white differences – more research is needed to understand disparities among other racial and ethnic minority groups

What is the Evidence that Physician Biases and Stereotypes May Influence the Clinical Encounter?

- van Ryn and Burke (2000) - study conducted in actual clinical settings found that doctors are more likely to ascribe negative racial stereotypes to their minority patients. These stereotypes were ascribed to patients even when differences in minority and non-minority patients' education, income, and personality characteristics were considered.
- Finucane and Carrese (1990) - Physicians more likely to make negative comments when discussing minority patients' cases.

Infants' Mortality in the U.S. Rose in '02

The nation's infant mortality rate climbed from 6.8 deaths per 1,000 live births in 2001 to 7.0 deaths per 1,000 in 2002.

The U.S. numbers mirrored Nebraska's infant mortality rate for the same years. Measured over time, though, Nebraska babies fared worse than the rest of the nation. Nebraska **traditionally** has had one of the nation's worst mortality rates for African-American babies.

Omaha World Herald, Thursday, February 12, 2004

1% increase in racial disrespect was associated with an increase of 350.8/100,000 in all cause mortality among African Americans.

Kennedy B, et al, in (DIS) Respect and black mortality, Ethn Dis 1997;7:207-14

What Needs To Be Done

- Recognition
- Vigilance
- Monitoring
- Education of Providers

Racial and ethnic inequalities will not disappear without a commitment from the individuals who make treatment decisions and provide care.

Munsey S. Wheby, FACP

Knowing is not enough,
we must apply
Willing is not enough,
we must do

Von Goethe (1749-1832)
